

## 24-Bit, 96 kHz Stereo DAC for Audio

### Features

- Complete Stereo DAC System: Interpolation, D/A, Output Analog Filtering
- 101 dB Dynamic Range
- 91 dB THD+N
- Low Clock Jitter Sensitivity
- +3 V to +5 V Power Supply
- Filtered Line Level Outputs
- On-Chip Digital De-emphasis for 32, 44.1, and 48 kHz
- 30 mW with 3 V supply
- Popguard<sup>®</sup> Technology for Control of Clicks and Pops

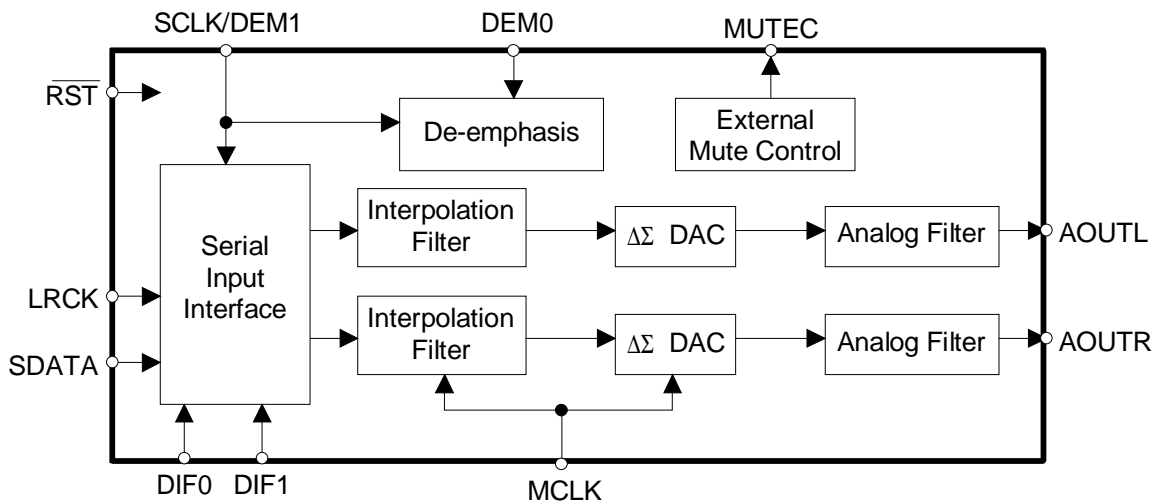

### Description

The CS4340 is a complete stereo digital-to-analog system including digital interpolation, fourth-order delta-sigma digital-to-analog conversion, digital de-emphasis and switched capacitor analog filtering. The advantages of this architecture include: ideal differential linearity, no distortion mechanisms due to resistor matching errors, no linearity drift over time and temperature and a high tolerance to clock jitter.

The CS4340 accepts data at audio sample rates from 2 kHz to 100 kHz, consumes very little power, and operates over a wide power supply range. The features of the CS4340 are ideal for DVD players, CD players, set-top box and automotive systems.

### ORDERING INFORMATION

CS4340-KS	16-pin SOIC, -10 to 70 °C
CS4340-BS	16-pin SOIC, -40 to 85 °C
CDB4340	Evaluation Board

### Preliminary Product Information

This document contains information for a new product. Cirrus Logic reserves the right to modify this product without notice.

Interchannel Isolation (1 kHz)		-	102	-	-	102	-	dB		

Notes: 3. CS4340-BS parts are tested at the extremes of the specified temperature range and Min/Max performance numbers are guaranteed across the specified temperature range, T<sub>A</sub>. Typical numbers are taken at 25 °C.

**ANALOG CHARACTERISTICS** (Continued)

Parameters	Symbol	Min	Typ	Max	Units
<b>Analog Output</b>					
Full Scale Output Voltage		0.63•VA	0.7•VA	0.77•VA	Vpp
Quiescent Voltage	$V_Q$	-	0.5•VA	-	VDC
Interchannel Gain Mismatch		-	0.1	-	dB
Gain Drift		-	100	-	ppm/°C
AC-Load Resistance (Note 4)	$R_L$	3	-	-	k $\Omega$
Load Capacitance (Note 4)	$C_L$	-	-	100	pF

Parameter	Symbol	Base-rate Mode			High-Rate Mode			Unit
		Min	Typ	Max	Min	Typ	Max	
<b>Combined Digital and On-chip Analog Filter Response (Note 5)</b>								
Passband (Note 6)								
to -0.05 dB corner		0	-	.4535	-	-	-	Fs
to -0.1 dB corner		-	-	-	0	-	.4621	Fs
to -3 dB corner		0	-	.4998	0	-	.4982	Fs
Frequency Response 10 Hz to 20 kHz		-.02	-	+.08	-0.06	-	0.2	dB
StopBand		.5465	-	-	.577	-	-	Fs
StopBand Attenuation (Note 7)		50	-	-	55	-	-	dB
Group Delay	tgd	-	9/Fs	-	-	4/Fs	-	s
Passband Group Delay Deviation 0 - 40 kHz		-	-	-	-	$\pm 1.39/Fs$	-	s
0 - 20 kHz		-	$\pm 0.36/Fs$	-	-	$\pm 0.23/Fs$	-	s
De-emphasis Error (Relative to 1 kHz)		-	-	+.2/- .1	(Note 8)			dB
	Fs = 44.1 kHz	-	-	+.05/- .14				dB
	Fs = 48 kHz	-	-	+0/- .22				dB

- Notes:
- Refer to Figure 14.
  - Filter response is guaranteed by design.
  - Response is clock dependent and will scale with Fs. Note that the response plots (Figures 5-12) have been normalized to Fs and can be de-normalized by multiplying the X-axis scale by Fs.
  - For Base-Rate Mode, the measurement bandwidth is 0.5465 Fs to 3 Fs.  
For High-Rate Mode, the measurement bandwidth is 0.577 Fs to 1.4 Fs.
  - De-emphasis is not available in High-Rate Mode.

**POWER AND THERMAL CHARACTERISTICS**

Parameters		Symbol	CS4340-KS			CS4340-BS			Units
			Min	Typ	Max	Min	Typ	Max	
<b>Power Supplies</b>									
Power Supply Current VA = 5 V	normal operation	$I_A$	-	15	18	-	15	TBD	mA
	power-down state	$I_A$	-	60	-	-	60	-	$\mu$ A
Power Dissipation VA = 5 V	(Note 9) normal operation		-	75	90	-	75	TBD	mW
	power-down		-	0.3	-	-	0.3	-	mW
Power Supply Current VA = 3 V	normal operation	$I_A$	-	10	14	-	10	TBD	mA
	power-down state	$I_A$	-	30	-	-	30	-	$\mu$ A
Power Dissipation VA = 3 V	(Note 9) normal operation		-	30	42	-	30	TBD	mW
	power-down		-	0.09	-	-	0.09	-	mW
Package Thermal Resistance		$\theta_{JA}$	-	110	-	-	110	-	$^{\circ}$ C/Watt
Power Supply Rejection Ratio (1 kHz)	(Note 10) (60 Hz)	PSRR	-	60	-	-	60	-	dB
			-	40	-	-	40	-	dB

Notes: 9. Refer to Figure 15.

10. Valid with the recommended capacitor values on FILT+ and VQ as shown in Figure 4. Increasing the capacitance will also increase the PSRR.

**DIGITAL CHARACTERISTICS** (for -KS parts  $T_A = -10$  to  $70^{\circ}$ C; for -BS parts  $T_A = -40$  to  $85^{\circ}$ C; VA = 2.7 V - 5.5 V)

Parameters	Symbol	Min	Typ	Max	Units	
High-Level Input Voltage	VA = 5 V	$V_{IH}$	2.0	-	-	V
	VA = 3 V		2.0	-	-	V
Low-Level Input Voltage	VA = 5 V	$V_{IL}$	-	-	0.8	V
	VA = 3 V		-	-	0.8	V
Input Leakage Current	$I_{in}$	-	-	$\pm 10$	$\mu$ A	
Input Capacitance		-	8	-	pF	
Maximum MUTE <sub>C</sub> Drive Current		-	3	-	mA	

**ABSOLUTE MAXIMUM RATINGS** (AGND = 0 V; all voltages with respect to ground.)

Parameters	Symbol	Min	Max	Units
DC Power Supply	VA	-0.3	6.0	V
Input Current, Any Pin Except Supplies	I <sub>in</sub>	-	±10	mA
Digital Input Voltage	V <sub>IND</sub>	-0.3	VA+0.4	V
Ambient Operating Temperature (power applied)	T <sub>A</sub>	-55	125	°C
Storage Temperature	T <sub>stg</sub>	-65	150	°C

WARNING: Operation at or beyond these limits may result in permanent damage to the device. Normal operation is not guaranteed at these extremes.

**RECOMMENDED OPERATING CONDITIONS** (AGND = 0V; all voltages with respect to ground.)

Parameters	Symbol	Min	Typ	Max	Units
DC Power Supply	VA	2.7	5.0	5.5	V

**SWITCHING CHARACTERISTICS** ( $V_A = 2.7\text{ V} - 5.5\text{ V}$ ; Inputs: Logic 0 = 0 V, Logic 1 =  $V_A$ ,  $CL = 20\text{ pF}$ ; for -KS parts  $T_A = -10\text{ to }70^\circ\text{C}$ ; for -BS parts  $T_A = -40\text{ to }85^\circ\text{C}$ )

Parameters	Symbol	Min	Typ	Max	Units
Input Sample Rate	Fs	Base-Rate Mode	-	50	kHz
		High-Rate Mode	-	100	
MCLK Pulse Width High	MCLK/LRCK = 512	10	-	1000	ns
MCLK Pulse Width Low	MCLK/LRCK = 512	10	-	1000	ns
MCLK Pulse Width High	MCLK / LRCK = 384 or 192	21	-	1000	ns
MCLK Pulse Width Low	MCLK / LRCK = 384 or 192	21	-	1000	ns
MCLK Pulse Width High	MCLK / LRCK = 256 or 128	31	-	1000	ns
MCLK Pulse Width Low	MCLK / LRCK = 256 or 128	31	-	1000	ns
<b>External SCLK Mode</b>					
LRCK Duty Cycle (External SCLK only)		40	50	60	%
SCLK Pulse Width Low	$t_{sckl}$	20	-	-	ns
SCLK Pulse Width High	$t_{sckh}$	20	-	-	ns
SCLK Period	MCLK / LRCK = 512, 256 or 384 $t_{sckw}$	$\frac{1}{(128)F_s}$	-	-	ns
SCLK Period	MCLK / LRCK = 128 or 192 $t_{sckw}$	$\frac{1}{(64)F_s}$	-	-	ns
SCLK rising to LRCK edge delay	$t_{slrd}$	20	-	-	ns
SCLK rising to LRCK edge setup time	$t_{slrs}$	20	-	-	ns
SDATA valid to SCLK rising setup time	$t_{sdhrs}$	20	-	-	ns
SCLK rising to SDATA hold time	$t_{sdh}$	20	-	-	ns
<b>Internal SCLK Mode</b>					
LRCK Duty Cycle (Internal SCLK only)	(Note 11)	-	50	-	%
SCLK Period	(Note 12) $t_{sckw}$	$\frac{1}{SCLK}$	-	-	ns
SCLK rising to LRCK edge	$t_{sckr}$	-	$\frac{t_{sckw}}{2}$	-	$\mu\text{s}$
SDATA valid to SCLK rising setup time	$t_{sdhrs}$	$\frac{1}{(512)F_s} + 10$	-	-	ns
SCLK rising to SDATA hold time	MCLK / LRCK = 512, 256 or 128 $t_{sdh}$	$\frac{1}{(512)F_s} + 15$	-	-	ns
SCLK rising to SDATA hold time	MCLK / LRCK = 384 or 192 $t_{sdh}$	$\frac{1}{(384)F_s} + 15$	-	-	ns

Notes: 11. In Internal SCLK Mode, the Duty Cycle must be 50% +/- 1/2 MCLK Period.

12. The SCLK / LRCK ratio may be either 32, 48, or 64. This ratio depends on part type and MCLK/LRCK ratio. (See figures 16-19)

**Figure 1. External Serial Mode Input Timing**

**Figure 2. Internal Serial Mode Input Timing**

\*The SCLK pulses shown are internal to the CS4340.

**Figure 3. Internal Serial Clock Generation**

\* The SCLK pulses shown are internal to the CS4340.

N equals MCLK divided by SCLK

### 3. PIN DESCRIPTION

Reset	<b>RST</b>	□ 1	□ 16	<b>MUTEC</b>	Mute Control
Serial Data	<b>SDATA</b>	□ 2	□ 15	<b>AOUTL</b>	Left Analog Output
Serial Clock / De-emphasis	<b>SCLK/DEM1</b>	□ 3	□ 14	<b>VA</b>	Analog Power
Left/Right Clock	<b>LRCK</b>	□ 4	□ 13	<b>AGND</b>	Analog Ground
Master Clock	<b>MCLK</b>	□ 5	□ 12	<b>AOUTR</b>	Right Analog Output
Digital Interface Format	<b>DIF1</b>	□ 6	□ 11	<b>REF_GND</b>	Reference Ground
Digital Interface Format	<b>DIF0</b>	□ 7	□ 10	<b>VQ</b>	Quiescent Voltage
De-emphasis	<b>DEM0</b>	□ 8	□ 9	<b>FILT+</b>	Positive Voltage Reference

<b>RST</b>	1	<b>Reset (Input)</b> - The device enters a low power mode and all internal state machines are reset to the default settings when low. $\overline{\text{RST}}$ should be held low during power-up until the power supply, master and left/right clocks are stable.
<b>SDATA</b>	2	<b>Serial Audio Data (Input)</b> - Two's complement MSB-first serial data is input on this pin. The data is clocked into SDATA via the serial clock and the channel is determined by the Left/Right clock. The required relationship between the Left/Right clock, serial clock and serial data is defined by the DIF1-0 pins. The options are detailed in Figures 16-19.
<b>SCLK</b>	3	<p><b>Serial Clock (Input)</b> - Clocks the individual bits of the serial data into the SDATA pin. The required relationship between the Left/Right clock, serial clock and serial data is defined by the DIF1-0 pins. The options are detailed in Figures 16-19.</p> <p>The CS4340 supports both internal and external serial clock generation modes. Internal SCLK mode is used to gain access to extra de-emphasis modes.</p> <p><u>Internal Serial Clock Mode</u> - In the Internal Serial Clock Mode, the serial clock is internally derived and synchronous with the master clock and left/right clock. The SCLK/LRCK frequency ratio is either 32, 48, or 64 depending upon the DIF1-0 pins as shown in Figures 16-19. Operation in this mode is identical to operation with an external serial clock synchronized with LRCK.</p> <p><u>External Serial Clock Mode</u> - The CS4340 will enter the External Serial Clock Mode whenever 16 low to high transitions are detected on the SCLK pin during any phase of the LRCK period. The device will revert to Internal Serial Clock Mode if no low to high transitions are detected on the SCLK pin for 2 consecutive periods of LRCK.</p>

DEM1 and DEM0      3 & 8 **De-emphasis Control (Input)** - Implementation of the standard 15 $\mu$ s/50 $\mu$ s digital de-emphasis filter response, Figure 20, requires reconfiguration of the digital filter to maintain the proper filter response for 32, 44.1 or 48 kHz sample rates. When using Internal Serial Clock Mode, as described above, Pin 3 is available for de-emphasis control, DEM1, and all de-emphasis filters are available, Table 3. When using External Serial Clock Mode, as described above, Pin 3 is not available for de-emphasis use and only the 44.1 kHz de-emphasis filter is available, Table 4. NOTE: De-emphasis is not available in High-Rate Mode.

DEM1	DEMO	DESCRIPTION
0	0	Disabled
0	1	44.1kHz
1	0	48kHz
1	1	32kHz

**Table 1. Internal Serial Clock Mode**

DEMO	DESCRIPTION
0	Disabled
1	44.1kHz

**Table 2. External Serial Clock Mode**

LRCK      4 **Left/Right Clock (Input)** - The Left/Right clock determines which channel is currently being input on the serial audio data input, SDATA. The frequency of the Left/Right clock must be at the input sample rate. Audio samples in Left/Right sample pairs will be simultaneously output from the digital-to-analog converter whereas Right/Left pairs will exhibit a one sample period difference. The required relationship between the Left/Right clock, serial clock and serial data is defined by the DIF1-0 pins. The options are detailed in Figures 16-19.

MCLK      5 **Master Clock (Input)** - The master clock frequency must be either 256x, 384x or 512x the input sample rate in Base Rate Mode (BRM) and either 128x or 192x the input sample rate in High Rate Mode (HRM). Table 3 illustrates several standard audio sample rates and the required master clock frequencies.

Sample Rate (kHz)	MCLK (MHz)				
	HRM		BRM		
	128x	192x	256x	384x	512x
32	4.0960	6.1440	8.1920	12.2880	16.3840
44.1	5.6448	8.4672	11.2896	16.9344	22.5792
48	6.1440	9.2160	12.2880	18.4320	24.5760
64	8.1920	12.2880	-	-	-
88.2	11.2896	16.9344	-	-	-
96	12.2880	18.4320	-	-	-

**Table 3. Common Master Clock Frequencies**

DIF1 and DIF0      6 & 7 **Digital Interface Format (Input)** - The required relationship between the Left/Right clock, serial clock and serial data is defined by the Digital Interface Format and the options are detailed in Figures 16-19

DIF1	DIF0	DESCRIPTION	FORMAT	FIGURE
0	0	I <sup>2</sup> S, up to 24-bit data	0	16
0	1	Left Justified, up to 24-bit data	1	17
1	0	Right Justified, 24-bit Data	2	18
1	1	Right Justified, 16-bit Data	3	19

**Table 4. Digital Interface Format - DIF1 and DIF0**

FILT+	9	<b>Positive Voltage Reference (Output)</b> - Positive reference for internal sampling circuits. An external capacitor is required from FILT+ to analog ground, as shown in Figure 4. The recommended value will typically provide 60 dB of PSRR at 1 kHz and 40 dB of PSRR at 60 Hz. FILT+ is not intended to supply external current. FILT+ has a typical source impedance of 250 kΩ and any current drawn from this pin will alter device performance.
VQ	10	<b>Quiescent Voltage (Output)</b> - Filter connection for internal quiescent reference voltage, typically 50% of VA. Capacitors must be connected from VQ to analog ground, as shown in Figure 4. VQ is not intended to supply external current. VQ has a typical source impedance of 250 kΩ and any current drawn from this pin will alter device performance.
REF_GND	11	<b>Reference Ground (Input)</b> - Ground reference for the internal sampling circuits. Must be connected to analog ground.
AOUTR and AOUTL	12 & 15	<b>Analog Outputs (Output)</b> - The full scale analog output level is specified in the Analog Characteristics specifications table.
AGND	13	<b>Ground (Input)</b> - Ground Reference.
VA	14	<b>Analog Power (Input)</b> - Analog power supply. Typically 3 to 5 VDC.
MUTEC	16	<b>Mute Control (Output)</b> - The Mute Control pin goes high during power-up initialization, reset, muting, master clock to left/right clock frequency ratio is incorrect or power-down. This pin is intended to be used as a control for an external mute circuit to prevent the clicks and pops that can occur in any single supply system. Use of Mute Control is not mandatory but recommended for designs requiring the absolute minimum in extraneous clicks and pops.

## 4. APPLICATIONS

### 4.1 Grounding and Power Supply Decoupling

As with any high resolution converter, the CS4340 requires careful attention to power supply and grounding arrangements to optimize performance. Figure 4 shows the recommended power arrangement with VA connected to a clean supply. Decoupling capacitors should be located as close to the device package as possible.

### 4.2 Oversampling Modes

The CS4340 operates in one of two oversampling modes. Base Rate Mode supports input sample rates up to 50 kHz while High Rate Mode supports input sample rates up to 100 kHz. The devices operate in Base Rate Mode (BRM) when MCLK/LRCK is 256, 384 or 512 and in High Rate Mode (HRM) when MCLK/LRCK is 128 or 192.

### 4.3 Recommended Power-up Sequence

$\overline{\text{RST}}$  should be held low until the power supply, master and left/right clocks are stable.

### 4.4 Popguard<sup>®</sup> Transient Control

The CS4340 uses Popguard<sup>®</sup> technology to minimize the effects of output transients during power-up and power-down. This technique, when used with external DC-blocking capacitors in series with the audio outputs, minimizes the audio transients commonly produced by single-ended single-supply converters.

When the device is initially powered-up, the audio outputs, AOUTL and AOUTR, are clamped to AGND. Following a delay of approximately 1000 sample periods, each output begins to ramp toward the quiescent voltage. Approximately 10,000 left/right clock cycles later, the outputs reach  $V_Q$  and audio output begins. This gradual voltage ramping allows time for the external DC-blocking capacitor to charge to the quiescent voltage, minimizing the power-up transient.

To prevent transients at power-down, the device must first enter its power-down state by setting the  $\overline{\text{RST}}$  pin low. When this occurs, audio output ceases and the internal output buffers are disconnected from AOUTL and AOUTR. In their place, a soft-start current sink is substituted which allows the DC-blocking capacitors to slowly discharge. Once this charge is dissipated, the power to the device may be turned off and the system is ready for the next power-on.

To prevent an audio transient at the next power-on, it is necessary to ensure that the DC-blocking capacitors have fully discharged before turning off the power or exiting the power-down state. If not, a transient will occur when the audio outputs are initially clamped to AGND. The time that the device must remain in the power-down state is related to the value of the DC-blocking capacitance. For example, with a 3.3  $\mu\text{F}$  capacitor, the minimum power-down time will be approximately 0.4 seconds.

Use of the Mute Control function is recommended for designs requiring the absolute minimum in extraneous clicks and pops. Also, use of the Mute Control function can enable the system designer to achieve idle channel noise/signal-to-noise ratios which are only limited by the external mute circuit. See the CDB4340/41 data sheet for a suggested mute circuit.

**7. ANALOG PERFORMANCE PLOTS**

The following CS4340 Analog Performance Plots were taken from the CDB4340 evaluation board using the Audio Precision Dual Domain System Two Cascade. All Base Rate Mode (BRM) plots were taken at a 48 kHz sample rate with a 20 Hz to 20 kHz bandwidth using a 20 kHz low-pass brick-

wall filter in the DSP Analyzer. All High Rate Mode (HRM) plots were taken at a 96 kHz sample rate with a 20 Hz to 40 kHz bandwidth using a 40 kHz brickwall filter in the DSP Analyzer.

## **8. PARAMETER DEFINITIONS**

### **Total Harmonic Distortion + Noise (THD+N)**

A measure of crosstalk between the left and right channels. Measured for each channel at the converter's output with all zeros to the input under test and a full-scale signal applied to the other channel. Units in decibels.

### **Dynamic Range**

The ratio of the full scale rms value of the signal to the rms sum of all other spectral components over the specified bandwidth. Dynamic range is a signal-to-noise measurement over the specified bandwidth made with a -60 dBFS signal. 60 dB is then added to the resulting measurement to refer the measurement to full scale. This technique ensures that the distortion components are below the noise level and do not effect the measurement. This measurement technique has been accepted by the Audio Engineering Society, AES17-1991, and the Electronic Industries Association of Japan, EIAJ CP-307.

### **Interchannel Isolation**

A measure of crosstalk between the left and right channels. Measured for each channel at the converter's output with all zeros to the input under test and a full-scale signal applied to the other channel. Units in decibels.

### **Interchannel Gain Mismatch**

The gain difference between left and right channels. Units in decibels.

### **Gain Error**

The deviation from the nominal full scale analog output for a full scale digital input.

### **Gain Drift**

The change in gain value with temperature. Units in ppm/°C.
